

Just Regulation: Improving Distributional Analysis in Agency Rulemaking

Richard L. Revesz* and Burçin Ünel**

Taking account of the impacts of government action on historically marginalized and overburdened communities is a core policy goal of the Biden-Harris Administration. With respect to regulatory action, the Memorandum on Modernizing Regulatory Review, which President Biden issued on his first day in office, directed the Office of Management and Budget to take steps “to ensure that regulatory initiatives appropriately benefit and do not inappropriately burden disadvantaged, vulnerable, or marginalized communities.” While the efforts in this regard have gone beyond those of the Clinton and Obama Administrations, federal regulations still pay limited attention to regulatory consequences on disadvantaged communities.

In this Article, we seek to understand the shortcomings of current agency practice and outline what agencies can do better. To do so, we examine fifteen significant proposed or final agency rules promulgated during the Biden-Harris Administration’s first eighteen months. This empirical analysis reveals four categories of limitations. First, agencies often pursue inconsistent goals across different regulatory initiatives. Second, they do not grapple with the core issue that distributional analysis should raise: the extent to which the better distributional consequences of one alternative should trump the higher net benefits of another alternative. Third, agencies do not apply a consistent approach to defining disadvantaged groups, which makes the analysis inconsistent and unpredictable. Fourth, the distributional analysis relies on a truncated set of costs and benefits, and thus presents an incomplete picture of the consequences of regulation on disadvantaged communities. One of the fifteen

INTRODUCTION

The Biden-Harris Administration has underscored, to an extent not done by any prior administrations, the central importance it attaches to the well-being of disadvantaged communities.¹ Reflecting this priority, during his first week in office, President Biden issued two significant directives that undertook important commitments for his administration.

First, Executive Order 14008, “Tackling the Climate Crisis at Home and Abroad,” sets forth the Justice40 Initiative, which provides that 40 percent of the benefits of certain federal investments, including ones to remediate pollution, develop clean water infrastructure, and promote clean energy, energy efficiency, and clean transit, flow to disadvantaged communities.² The executive order defines “disadvantaged communities” as ones that are “historically marginalized and overburdened.”³ The Justice40 Initiative is seen as the Biden-Harris Administration’s signature environmental justice commitment.⁴

Second, the 2021 Presidential Memorandum on “Modernizing Regulatory Review” focuses specifically on how distributional consequences should be

1. See, e.g., Exec. Order No. 13985, 86 Fed. Reg. 7009 (Jan. 20, 2021) (directing the administration to “pursue a comprehensive approach to advancing equity for all, including people of color and others who have been historically underserved, marginalized, and adversely affected by persistent poverty and inequality”).

2. Exec. Order No. 14008 § 223, 86 Fed. Reg. 7619, 7632 (Feb. 1, 2021).

taken into account in the regulatory process.⁵ It requests that the Director of the Office of Management and Budget (OMB) “propose procedures that take into account the distributional consequences of regulations . . . to ensure that regulatory initiatives appropriately benefit and do not inappropriately burden disadvantaged, vulnerable, or marginalized communities.”⁶

The Clinton and Obama Administrations had similarly indicated that distributional analyses be conducted alongside the cost-benefit analyses required under Executive Order 12866 to justify federal regulations⁷—a cost-benefit requirement that President Biden reaffirmed.⁸ But the prior efforts to take meaningful account of distributional consequences in the regulatory process has not been fully successful.⁹ As a result, the Biden memorandum has the promise of leading to the first serious effort to make distributional analysis an important part of the regulatory process.

While OMB has not yet proposed the procedures to take distributional effects into account called for in the memorandum on Modernizing Regulatory Review, the efforts in this direction have already gone beyond the practices under the Clinton and Obama Administrations.¹⁰ But this Article shows that a great deal of work remains to be done.

To evaluate the Biden-Harris Administration’s performance to date on accounting for the distributional consequences of regulations, we examine fifteen significant proposed or final agency rules promulgated during the administration’s first eighteen months, which are listed in the Appendix.¹¹ Using *Washington Post*’s environmental action tracker,¹² we identified rules that contained regulatory impact analyses and had been proposed or finalized at the time we started our work on this Article in July 2022. Of these rules, we mainly focused our analysis on Department of Energy (DOE) and Environmental Protection Agency (EPA) rules because these agencies have done at least some

10. See *id.*

11. Where possible, we reviewed final rules, but if a final rule had not yet been promulgated at the time of our analysis, we reviewed the proposed rule.

12. Juliet Eilperin et al., *Tracking Biden’s Environmental Actions*, WASH. POST, <https://www.washingtonpost.com/graphics/2021/climate-environment/biden-climate-environment-actions> (last updated Jan. 12, 2024, 2:37 PM).

limited distributional analysis in the past.¹³ But we also consider rules promulgated by other agencies, including the Consumer Product Safety Commission (CPSC), National Highway Traffic Safety Administration (NHTSA), and Pipeline and Hazardous Materials Safety Administration (PHMSA), to better understand differences across agency practices. Our sample is not a complete or representative sample of all proposed or final rules under the Biden-Harris Administration, and our goal is not to run a statistical analysis of the rules and their parameters. Rather, we use these case studies to critique how agencies are conducting distributional analyses and to assess what remains to be done for such analysis to become a meaningful part of the regulatory process.¹⁴

In our analysis, we first looked at whether the agency included a distributional analysis. If there was a distributional analysis, we ascertained the goal of the analysis; whether the analysis looked at the baseline, the proposed or final rule, or the alternatives; how the cost and benefits in the distributional analyses compared to the regulatory impact analysis; which demographic groups agencies considered in their analyses and with what granularity; and if the distributional analysis played a role in the final decision.

This Article finds that agencies do not effectively leverage distributional analyses to consider and promote environmental justice in regulatory decision-making. For five of the fifteen regulations, the respective agencies do not conduct a distributional analysis at all.¹⁵ But even when they do, this Article shows that the analysis is generally truncated, inconsistent, or inadequate.

Part I shows that agencies lack a consistent goal to inform their distributional analysis. The command in the Modernizing Regulatory Review memorandum “that regulatory initiatives appropriately benefit and do not inappropriately burden disadvantaged, vulnerable, or marginalized communities”¹⁶ can be operationalized in multiple, mutually inconsistent ways. For example, a rule that does not disproportionately burden disadvantaged communities might also not provide net benefits to those communities. Or a rule that provides the highest net benefits to disadvantaged communities might not

13. Caroline Cecot & Robert W. Hahn, *Incorporating Equity Concerns in Regulation*, 18 REGUL. & GOVERNANCE 99, 100 (2024) (originally publ'd as George Mason L. & Econ. Rsch. Paper Series, No. 22-19, updated Nov. 2022).

14. Similarly, as our goal was to provide a snapshot at one point in time, we did not redo our analysis if a proposed rule in our sample got finalized while we drafted the Article.

15. See generally Energy Conservation Program: Energy Conservation Standards for General Service Lamps [hereinafter Energy Conservation Standards for General Service Lamps], 87 Fed. Reg. 27439 (May 9, 2022) (to be codified at 10 C.F.R. pt. 430); Corporate Average Fuel Economy Standards for Model Years 2024–2026 Passenger Cars and Light Trucks, 87 Fed. Reg. 25710 (May 2, 2022) (to be codified at 49 C.F.R. pts. 531, 533, 536, 537); Pipeline Safety: Requirement of Valve Installation and Minimum Rupture Detection Standards, 87 Fed. 16. See Modernizing Regulatory Review, 86 Fed. Reg. 7223, 7223 (Jan. 26, 2021).

minimize the harm on those communities. Yet, thus far, agencies have not coalesced around a uniform understanding of their distributional goals.

In Part II, we explain that agencies generally fail to consider the distributional analyses of regulatory alternatives. In some cases, they simply suggest that a rule produces benefits for disadvantaged communities by merely establishing that the pre-rule status quo disproportionately burdened these communities but provide no further evaluation. Analysis of this sort does not ensure that the benefits of the rule will necessarily accrue to the disadvantaged communities. In other rules, agencies do conduct this additional analysis, but they only rarely analyze the distributional consequences of alternatives to the proposed rule. As a result, they cannot evaluate the key issue for distributional analysis: how to trade off the higher net benefits of one alternative against the better distributional consequences of another.¹⁷

Part III documents how the distributional analyses in different regulations focus on different types of disadvantaged groups. For some regulations, the focus is on racial or ethnic groups, with the information sometimes presented in aggregated fashion and, other times, disaggregated. Other regulations instead use income measures of disadvantage. And yet others focus on both types of considerations. No explanations are provided for these different methodological approaches. Without a consistent approach across agencies and regulations to determining what counts as a disadvantaged community or an explanation about why it is appropriate to use different definitions of disadvantage for different regulations, there is a risk that the distributional analyses will be manipulated to reach predetermined outcomes.¹⁸

In Part IV, we criticize the distributional analyses in the regulations we analyze for examining only a truncated set of costs and benefits. In particular, some of the benefits and costs examined in the regulations' cost-benefit analysis are not taken into account for the distributional analysis. It is obviously necessary to consider all significant benefits and costs to determine whether a regulation's benefits justify its costs—an inquiry required by Executive Order 12866.¹⁹ But it is equally critical to consider the full range of significant cost and benefits to determine a regulation's consequences on disadvantaged communities.

Despite the various shortcomings, there are glimmers of what an attractive approach to distributional analysis might look like. In Part V, we highlight one rule, DOE's Energy Conservation Standards for Consumer Clothes Dryers rule, that looks at distributional consequences in a more comprehensive way than the norm. This rule provides an attractive model for other agencies to follow. But we show that, despite this promise, it still exhibits significant shortcomings. These

17. See Revesz & Yi, *supra* note 9, at 56–57.

18. See *id.* at 57.

19. Exec. Order No. 12866, 58 Fed. Reg. 51735, 51735 (Oct. 4, 1993) (“In deciding whether and how to regulate, agencies should assess all costs and benefits of available regulatory alternatives, including the alternative of not regulating.”).

need to be addressed for distributional analysis to occupy the place in the regulatory process that is consistent with the ambitions that the Biden-Harris Administration articulated during its first week in office.

I. INCONSISTENT GOALS

The Modernizing Regulatory Review memorandum directs agencies to ensure “that regulatory initiatives appropriately benefit and do not inappropriately burden disadvantaged, vulnerable, or marginalized communities.”²⁰ However, this directive can be operationalized in different and inconsistent ways. Indeed, the distributional analyses conducted during the Biden Administration lack clear and consistent goals. There is no explanation why one goal is used in certain regulations and other goals are used in others. Subpart A defines several distinct ways to operationalize distributional goals, based on both agency practice and other potential ways to interpret such goals. Subpart B shows how different goals guide the distributional analysis of different regulations and that the respective agencies provide no explanation or defense for the choice.

A. Multiple Possible Objectives

Distributional analysis provides agencies with additional data to inform its decision making among different potential rules by indicating how the costs and benefits of regulation affect different communities. But this information, however valuable, does not dictate *which* regulatory alternative an agency should select or *how* it should decide among competing alternatives. Instead, agencies need to establish clear objectives to inform their rule selection process so that their rules “appropriately benefit and do not inappropriately burden disadvantaged, vulnerable, or marginalized communities.”²¹

But the goal of “appropriately benefit[ing] and not inappropriately burden[ing]”²² is sufficiently broad that agencies can operationalize it in multiple ways, each with different distributional consequences. Because each of the possible choices leads to fundamentally different outcomes for disadvantaged communities, unexplained inconsistencies across agencies, and particularly across regulations in a single agency, are problematic.

The following simple example illustrates this point. Consider four possible alternatives for a given regulation, which promote, respectively, the following four distinctive goals: Harm Minimization, Justice40, No Disproportionate Burden, and Restorative/Remedial. While the four possible alternatives have the same aggregate net benefits, they have different distributional consequences due to the way they operationalize the administration’s distributional goals.

20. Modernizing Regulatory Review, 86 Fed. Reg. at 7223.

21. *Id.*

22. *Id.*

The Harm Minimization alternative, for example, minimizes the costs to disadvantaged communities as its central goal, but does not necessarily focus on increasing net benefits to these same communities. The Justice40 alternative, on the other hand, directs 40 percent of the net benefits of the regulation to disadvantaged communities, just as the Justice40 Initiative directs to these communities 40 percent of the net benefits of certain federal investments.²³ The No Disproportionate Burden alternative ensures that the burdens faced by disadvantaged communities are similar to the burdens faced by other communities. Finally, the Restorative/Remedial alternative allocates higher net benefits to disadvantaged communities compared to other communities, helping reduce inequality between the two groups.

Table 1 helps demonstrate how an agency interested in following the Modernizing Regulatory Review memorandum might decide among four alternatives depending on the guiding objective it relies on. Each row of the table represents one of these distributional approaches. The first three columns show the aggregate costs, benefits, and net benefits of each alternative to society. These illustrative values are the same across all four possible alternatives so that we can focus on the distributional consequences of each alternative on disadvantaged communities.

The next three columns show a hypothetical distribution of the costs, benefits, and net benefits of each alternative to disadvantaged communities, while the last three columns show the corresponding costs, benefits, and net benefits to other communities. The illustrative values in these two sections of columns represent how the costs, benefits, and net benefits may be distributed if an agency focused on each of the potential alternatives, demonstrating how focusing on different distributional goals can have significant effects on the distributional consequences of these regulations.

Table 1: Costs and Benefits of Four Hypothetical Regulatory Alternatives

	Total			Disadvantaged Communities			Others		
	Cost	Benefit	Net Benefit	Cost	Benefit	Net Benefit	Cost	Benefit	Net Benefit
<i>Harm Minimization</i>	100	150	50	20	10	-10	80	140	60
<i>Justice40</i>	100	150	50	30	50	20	70	100	30
<i>No Disproportionate Burden</i>	100	150	50	50	50	0	50	100	50
<i>Restorative/ Remedial</i>	100	150	50	30	60	30	70	90	20

23. See *supra* text accompanying notes 2–4.

An agency faced with the data in the table above is significantly better equipped to select an alternative that promotes the interests of disadvantaged communities than an agency that has not conducted a distributional analysis.²⁴ But the analysis alone does not provide clear instruction on which alternative the agency should select. All four choices could “appropriately benefit and do not inappropriately burden” depending on how those terms are defined.

The four alternatives have different distributional consequences. The Harm Minimization alternative above minimizes the adverse harm disadvantaged communities experience due to the rulemaking. As Table 1 demonstrates, this alternative could result in disadvantaged communities bearing a lower percentage of the costs than the other alternatives. However, this alternative provides a relatively small percentage of the benefits to these communities. The Justice40 alternative allocates 40 percent of the regulation’s net benefits to disadvantaged communities,²⁵ *but* an agency choosing this alternative may exacerbate existing inequalities because it can create an outcome that benefits non-disadvantaged communities more than disadvantaged ones. Next, the No Disproportionate Burden alternative does not “disproportionately” burden disadvantaged communities because the total costs of the alternative are borne equally between disadvantaged and non-disadvantaged communities, *but* because the focus is only on costs, the alternative might not provide net benefits to disadvantaged communities.²⁶ Lastly, the Restorative/Remedial alternative helps correct inequalities by providing higher net benefits to disadvantaged communities than others. This alternative could be remedying previous harms done to a community due to excessive pollution, or it could be a redistribution that does not specifically target an overburdened community.

While this example simplifies the decisions agencies face, it demonstrates several important conceptual points. First, it shows that rules have tradeoffs. Agencies need to understand these tradeoffs to make good distributional decisions. Second, it demonstrates the significance of the choice of the agency’s

24. See Modernizing Regulatory Review, 86 Fed. Reg. at 7223.

25. Exec. Order No. 14008, 86 Fed. Reg. 7619, 7631–32 (Feb. 1, 2021).

26. We put the term “disproportionately” in quotes here to acknowledge that the term can be interpreted in different ways. Here, we use the term to indicate that disadvantaged groups do not disproportionately bear the *absolute* costs of the rule. But even when the absolute costs borne by each group are the same, the welfare impacts on each group would not be because the marginal utility of income would be different between these two groups. Empirical studies find that fixed changes in wealth have larger impacts on individuals that begin with less wealth. See MATTHEW D. ADLER, MEASURING SOCIAL WELFARE: AN INTRODUCTION 16 (2019); see generally Matthew D. Adler, *Factoring Equity into Benefit-Cost Analysis*, REGUL. REV. (Apr. 26, 2021), <https://www.theregreview.org/2021/04/26/adler-factoring-equity-benefit-cost-analysis>. Our hypothetical is simplified to illustrate a conceptual point, but cost-benefit analysis could account for the differences in marginal utility that different groups experience gains or losses. See INST. FOR POL’Y INTEGRITY, COMMENTS ON AVENUES TO PROMOTE EQUITY AND ADVANCE ENVIRONMENTAL JUSTICE THROUGH RULEMAKING AND REGULATORY ANALYSIS 23–25 (July 6, 2021), https://policyintegrity.org/documents/Comments_on_Advancing_Equity_and_Supporting_Underserved_Communities.pdf (discussing how cost-benefit analysis could be conducted through utilitarian or prioritarian weighting to improve distributional outcomes).

objective. On a casual review, there might not seem to be much of a distinction between a goal of minimizing adverse harms to disadvantaged communities and a goal of avoiding disproportionate burdens to disadvantaged communities. Yet, the two goals could have different implications in terms of the rule that gets selected and the net benefits that accrue to disadvantaged communities. Third, and relatedly, it shows that neither a goal of minimizing harms nor avoiding disproportionate harms guarantees benefits to disadvantaged communities or a reduction in historical burdens. It is important to ensure that rules do not unnecessarily harm already disadvantaged communities or burden them disproportionately to more well-off communities, but when these goals are pursued in isolation, the agencies might forego important net benefits to disadvantaged communities.

The problem is compounded when there is a tradeoff—not present in the example above—when the alternative that maximizes the net benefits to society is not the one that scores best on the distributional front. We will turn to that issue in Part II.

B. Agency Objectives in Practice

As illustrated in the previous section, the agency's goals inform the alternative it selects, which may result in completely different outcomes for disadvantaged communities. And yet, it is not clear that agencies set these goals in consistent ways, fully aware of the implications of their decisions.

EPA rules, for example, tend to focus on whether the rulemaking creates “disproportionately high and adverse human health or environmental effects” for “minority populations, low-income populations, and/or indigenous peoples,” which is the No Disproportionate Burden alternative discussed above.²⁷ EPA developed this approach pursuant to language set forth in Executive Order 12898, promulgated during the Clinton Administration.²⁸ In it, President Clinton

27. EPA broadly endorses this approach in a technical guidance promulgated in 2016. EPA, TECHNICAL GUIDANCE FOR ASSESSING ENVIRONMENTAL JUSTICE IN REGULATORY ANALYSIS 1, 27 (Apr. 2016), https://www.epa.gov/sites/default/files/2016-06/documents/ejtg_5_6_16_v5.1.pdf (quoting Exec. Order No. 12989, 59 Fed. Reg. 7629, 7629-30 (Feb. 11, 1994)) (defining fair treatment to mean that “no group of people should bear a disproportionate burden of environmental harms and risks, including those resulting from the negative environmental consequences of industrial, governmental, and commercial operations or programs and policies.”).

28. *Id.* at 1, 4 (referencing Exec. Order No. 12898 59 Fed. Reg. 7629 (Feb. 11, 1994)). EPA also cites Executive Order 12898 in several rulemakings in our sample. *See, e.g.*, Revised Cross-State Air Pollution Rule Update for the 2008 Ozone NAAQS, 86 Fed. Reg. 23054, 23162 (Apr. 30, 2021) (to be codified at 40 C.F.R. pts. 51, 52, 78, 97); Phasedown of Hydrofluorocarbons: Establishing the Allowance Allocation and Trading Program Under the American Innovation and Manufacturing Act [hereinafter Phasedown of Hydrofluorocarbons], 86 Fed. Reg. 55116, 55125 (Oct. 5, 2021) (to be codified at 40 C.F.R. pts. 9, 84); National Emission Standards for Hazardous Air Pollutants: Carbon Black Production and Cyanide Chemicals Manufacturing Residual Risk and Technology Reviews, and Carbon Black Production Area Source Technology Review [hereinafter NESHAP: Carbon Black Prod. Tech. Rev.], 86 Fed. Reg. 66096, 66118 (Nov. 19, 2021) (to be codified at 40 C.F.R. pt. 63); National Emission Standards for Hazardous Air Pollutants: Flexible Polyurethane Foam Fabrication Operations Residual Risk and

instructed federal agencies to promote environmental justice by identifying and addressing “disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations.”²⁹ Accordingly, EPA finds that the distributional analysis is satisfied if a rule does not impose disproportionately high or adverse impacts on minority populations and/or low-income populations.³⁰

EPA embraces this approach in six rules we considered: (1) Revised Cross-State Air Pollution Rule (CSAPR) Update;³¹ (2) Phasedown of Hydrofluorocarbons;³² (3) National Emission Standards for Hazardous Air Pollutants (NESHAP): Carbon Black Production and Cyanide Chemical Manufacturing;³³ (4) NESHAP: Flexible Polyurethane Foam Fabrication Operations;³⁴ (5) NESHAP: Coal- and Oil-Fired Electric Utility Steam Generating Units;³⁵ and (6) Revised Definition of “Waters of the United States.”³⁶

For example, EPA notes that the NESHAP: Carbon Black Production and Cyanide Chemical Manufacturing rule is not likely to “result in a significant increase or decrease in any existing risk disparities for the demographic groups.”³⁷ Similarly, the agency indicates that the Revised Definition of “Waters

Technology Review and Flexible Polyurethane Foam Production and Fabrication Area Source Technology Review [hereinafter NESHAP: Flexible Polyurethane Foam Tech. Rev.], 86 Fed. Reg. 64385, 64385 (Nov. 18, 2021) (to be codified at 40 C.F.R. pt. 63).

29. Exec. Order No. 12898, 59 Fed. Reg. 7629, 7629–30 (Feb. 11, 1994).

30. See NESHAP: Carbon Black Prod. Tech. Rev., 86 Fed. Reg. at 66118; Revised Cross-State Air Pollution Rule Update for the 2008 Ozone NAAQS, 86 Fed. Reg. at 23163.

31. Revised Cross-State Air Pollution Rule Update for the 2008 Ozone NAAQS, 86 Fed. Reg. at 23162 (considering whether the rule “has the potential to result in disproportionately high and adverse human health or environmental impacts on vulnerable populations or overburdened communities . . .”).

32. Phasedown of Hydrofluorocarbons, 86 Fed. Reg. at 55125 (noting EPA’s requirement that rules address and identify “disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations and low-income populations in the United States.”).

33. NESHAP: Carbon Black Prod. Tech. Rev., 86 Fed. Reg. at 66118 (noting that EPA defines fair treatment to mean that “no group of people should bear a disproportionate burden of environmental harms and risks, including those resulting from the negative environmental consequences of industrial, governmental, and commercial operations or programs and policies.”).

34. NESHAP: Flexible Polyurethane Foam Fabrication Tech. Rev., 86 Fed. Reg. 64385, 64397 (Nov. 18, 2021) (to be codified at 40 C.F.R. pt. 63) (considering whether the rule would create “disproportionately high and adverse human health or environmental effects on minority populations, low-income populations, and/or indigenous peoples.”).

35. National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units—Revocation of the 2020 Reconsideration, and Affirmation of the Appropriate and Necessary Supplemental Finding; Notice of Proposed Rulemaking [hereinafter NESHAP: Coal- and Oil-Fired Electric Utility Steam Generating Units], 87 Fed. Reg. 7624, 7647 (proposed Feb. 9, 2022) (to be codified at 40 C.F.R. pt. 63) (noting the importance of “identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations and low-income populations.”).

36. Revised Definition of “Waters of the United States”, 86 Fed. Reg. 69372, 69382, 69386 (proposed Dec. 7, 2021) (to be codified at 33 C.F.R. pt. 328) (noting, in particular, the importance of considering disproportionate harms to “communities of color and low-income communities”).

37. NESHAP: Carbon Black Prod. Tech. Rev., 86 Fed. Reg. at 66119.

of the United States” rule, unlike its predecessor, does not impose disproportionate impacts on minority, low-income, or indigenous populations.³⁸ EPA uses the same argument for NESHAP: Coal- and Oil-Fired Electric Utility Steam Generating Units.³⁹ Further, EPA promulgates the Revised Cross-State Air Pollution Rule Update despite the absence of time to conduct a distributional analysis because there was insufficient information to suggest that disadvantaged communities would bear disproportionately high or adverse effects.⁴⁰

These rules reflect a consistent commitment to not disproportionately burden disadvantaged communities. However, as the third row of Table 1 shows, the fact that disadvantaged communities do not bear a disproportionate burden does not necessarily mean that they benefit from the rule. Critically, this approach may encourage EPA to pursue rulemakings that could benefit disadvantaged communities but that do not remedy historical inequalities.

In other rules, EPA takes more affirmative approaches to promoting benefits in disadvantaged communities. For example, in its cost-benefit analysis for Heavy-Duty Engine and Vehicle Standards, EPA “assessed whether areas with the worst projected baseline air quality in 2045 have larger numbers of people of color living in them, and if those with the worst projected air quality would *benefit more from the proposed rule*,” which is closer to the Restorative/Remedial alternative identified in the fourth of the table above.⁴¹ EPA notes that “relative to the rest of the population, people living near truck routes are more likely to be people of color and have lower incomes than the general population.”⁴² It determines that the rule, if implemented, would result in nationwide emissions reductions, improvements in air quality, and reductions in premature deaths and non-fatal illnesses.⁴³ EPA finds that these benefits would be particularly pronounced in areas with the worst baseline air quality—areas disproportionately populated by communities of color.⁴⁴ However, in this same rule, EPA also states that it seeks “to ensure that no group of people faces a disproportionate burden of exposure to mobile-source pollution,” in line with the No Disproportionate Burden alternative.⁴⁵

DOE, on the other hand, focuses on a hybrid approach of Harm Minimization and No Disproportionate Burden. In several rules, DOE seeks to

ensure that no consumer group would face significantly higher costs due to the implementation on its new Energy Conservation Standards for Consumer Clothes Dryers, reflecting the former approach.⁴⁶ In others, it notes that it “evaluates the impact on identifiable subgroups of consumers that may be disproportionately affected by a new or amended national standard . . . to determine the extent of any such disproportional impacts,” reflecting the latter approach.⁴⁷

II. LACK OF CONSIDERATION OF THE DISTRIBUTIONAL CONSEQUENCES OF ALTERNATIVES

Our analysis finds that agencies commonly suggest that a rule produces benefits for disadvantaged communities by performing only a baseline analysis—how the burdens are distributed under the pre-rule status quo. In these instances they do not consider how the rule or any potential alternatives affect the costs and benefits that accrue to these communities. We find that it is uncommon for agencies to look at the distributional consequences of the proposed rule and that it is even rarer for them to look at the distributional consequences of alternative rules. Without doing the latter analysis, agencies are not in a position to determine when the better distributional consequences of one alternative make that alternative more desirable than another with higher net benefits—the central inquiry that a distributional analysis should be designed to inform.⁴⁸

For example, in analyzing the environmental justice impacts of the Phasedown of Hydrofluorocarbons rule, EPA “focused mainly” on assessing and quantifying baseline emission exposures.⁴⁹ Its baseline analysis reveals that cancer and respiratory risks tend to be much higher within one to ten miles of a hydrofluorocarbon (HFC) production facility.⁵⁰ EPA’s analysis also finds that “higher percentages of low-income and Black or African-American individuals live near several HFC production facilities compared with the appropriate national and state level average.”⁵¹ Ultimately, based on this baseline analysis and research confirming that disadvantaged communities are particularly vulnerable to climate impacts,⁵² EPA concludes that “this rule reduces GHG

50. *Id.*

51. *Id.*

52. *Id.* at 55126 (citing, e.g., EPA, CLIMATE CHANGE AND SOCIAL VULNERABILITY IN THE UNITED STATES: A FOCUS ON SIX IMPACTS 4 (Sept. 2021); NAT’L ACAD. OF SCI., ENG’G, & MED., CLIMATE

[greenhouse gas] emissions, which will benefit populations that may be especially vulnerable to damages associated with climate change.”⁵³

Similarly, in proposing NESHAP: Coal- and Oil-Fired Electric Utility Steam Generating Units, EPA’s baseline demographic analysis reveals that low-income Black and white subsistence fishers were more likely to face toxic exposures from coal- and oil-fired electric utility steam generating units.⁵⁴ Based on these demographic findings, EPA reasons that disadvantaged communities were likely to benefit from emission standards regulating hazardous air pollutants from coal- and oil-fired electric utility steam generating units since they disproportionately suffer harms from it.⁵⁵

But baseline analyses, while necessary to understand the potentially affected populations, are not alone sufficient to conclude that a rule that reduces pollution nationwide would benefit disadvantaged communities. Without analyzing how pollution reductions or other costs and benefits associated with the rule are distributed between disadvantaged communities and others, agencies cannot conclusively infer that such a rule would benefit disadvantaged communities or reduce historical inequities. To reach such a conclusion, EPA would need to actually determine whether the proposed rule will reduce pollution in the areas where disadvantaged communities live, as opposed to elsewhere, or directly affect the sources of pollution located in disadvantaged communities and how those effects compare to outcomes in other communities. Similarly, the agency would also need to consider how the costs of the regulation are distributed between disadvantaged communities and others before concluding that a rule would benefit disadvantaged communities.

For only a few regulations in our sample does the agency analyze the distributional consequences of the rule itself in addition to those of the pre-rule baseline. For example, the distributional analysis for EPA’s Heavy-Duty Engine and Vehicle Standards compares the 2045 “no action” baseline to its proposed rule. EPA conducts this distributional analysis with regard to two demographics: race/ethnicity and income.⁵⁶ The agency first looks at the distribution of pollution in the 2045 baseline and finds that “nearly double the number of people of color live within areas with the worst ozone and PM_{2.5} air pollution compared

to non-Hispanic Whites.”⁵⁷ Then EPA finds that “the largest predicted improvements in both ozone and PM_{2.5} [from the proposed rule] are estimated to occur in areas with the worst baseline air quality, where a substantially larger number of people of color are expected to reside.”⁵⁸

Similarly, DOE’s Energy Conservation Standards for Manufactured Housing evaluates the impacts of the final rule on low-income consumers.⁵⁹ This distributional analysis was prompted by affordability concerns that the Department of Housing and Urban Development (HUD) and other commenters raised in response to DOE’s initial 2016 proposed rule Energy Conservation Standards for Manufactured Housing.⁶⁰ In response to these concerns, DOE adopts a tiered approach in the 2021 final rulemaking.⁶¹ DOE explores a range of alternatives in the lead up to the 2021 final rulemaking,⁶² but only conducts and publishes a quantitative consumer subgroup analysis for the final rule.⁶³ DOE deems the final rule acceptable because it “provide[s] the availability of homes for low-income consumers while still providing energy savings via improved energy efficiency.”⁶⁴

Importantly, our analysis reveals that agencies rarely analyze the distributional impacts of alternatives. While it is imperative that agencies analyze the distributional consequences of a proposed or final rule, stopping the analysis here is not sufficient to advance environmental justice goals, especially if the goal of the agency is to reduce historical inequities. Instead, that kind of policymaking requires agencies to also analyze the distributional consequences of proposed alternatives, and, for each alternative, weigh the distributional consequences against the net benefits.⁶⁵ Yet, even EPA’s Heavy-Duty Engine and Vehicle Standards, which was lauded from an environmental justice perspective,⁶⁶ analyzes the distributional consequences of only the proposed option and does not look at the alternative option considered in the rulemaking.

Of the fifteen rules studied, only two DOE rules analyzed the distributional impacts of both the regulation selected and its alternatives.⁶⁷ These rules are analyzed in Part V, which argues that they provide a promising first step toward the establishment of an attractive approach to taking distributional consequences into account in the regulatory process, despite some shortcomings.⁶⁸

Table 2 presents a summary of the rules evaluated. The table is organized by agency. For each rule, we show whether the agency engaged in a distributional analysis of the pre-rule status quo analysis, of the proposed rule, and of alternatives.

III. SELECTING SUBGROUPS

Standardizing the selection of demographic subgroups for distributional analyses, both within and across agencies, is key to successfully implementing the Biden-Harris Administration’s policy agenda. However, our analysis also finds that agencies are not consistent in which demographic groups they consider in their distributional analyses. There are discrepancies even within an agency. There is a risk, therefore, that a given distributional analysis will be manipulated to reach a predetermined result.⁸⁴

For example, the demographic analysis of EPA’s Heavy-Duty Engine and Vehicle Standards broadly considers impacts across two categories: race/ethnicity and income. EPA subdivides race/ethnicity into two groups: “people of color” and “Non-Hispanic White.” People of color include Black, Asian, Native American, Hawaiian/Pacific Islander, and Hispanic populations.⁸⁵ EPA measures income by poverty status, dividing people into two groups: those earning above 200 percent of the federal poverty line and those earning below that level.⁸⁶ EPA explains that it examines the effects of the rulemaking on these communities because “environmental hazards such as air pollution are more prevalent in areas where people of color and low-income populations represent a higher fraction of the population compared with the general population.”⁸⁷

82. Corporate Average Fuel Economy Standards for Model Years 2024-2026 Passenger Cars and Light Trucks, 87 Fed. Reg. 25710 (May 2, 2022) (to be codified at 49 C.F.R. pts. 531, 533, 536, 537).

86. *Id.* at 307.

87. Heavy-Duty Engine and Vehicle Standards, 87 Fed. Reg. 17414, 17452 (proposed Mar. 28, 2022) (to be codified at 40 C.F.R. pts 2, 59, 60, 80, 85–87, 600, 1027, 1030, 1033, 1036–37, 1039, 1042–43, 1045, 1048, 1051, 1054, 1060, 1065–66, 1068, 1090) (citing Gregory Rowangould, *A Census of The Near-Roadway Population: Public Health and Environmental Justice Considerations*, 25 TRANSP. RSCH. PART D 59 (2013); Julian D. Marshall, et al., *Prioritizing Environmental Justice and Equality: Diesel Emissions in Southern California*, 48 ENV’T SCI. TECH. 4063 (2014); Julian Marshall, *Environmental Inequality: Air Pollution Exposures in California’s South Coast Air Basin*, 42 ATMOSPHERIC ENV’T 5499 (2008)).

Further, it cites a recent study finding that light- and heavy-duty vehicle sources disproportionately affect people of color,⁸⁸ as well as its own analysis confirming that “people living near FAF4 truck routes are more likely to be people of color and have lower incomes than the general population.”⁸⁹ Overall, it notes “substantial evidence that people who live or attend school near major roadways are more likely to be of a non-White race, Hispanic, and/or have a low [socioeconomic status].”⁹⁰

In contrast, in NESHAP: Flexible Polyurethane Foam Production and NESHAP: Carbon Black Production and Cyanide Chemicals Manufacturing Source, EPA includes a broader set of demographic groups in its baseline analyses: White, African American, Native American, other races and multiracial, Hispanic or Latino, children 17 years of age and under, adults 18 to 64 years of age, adults 65 years of age and over, adults without a high school diploma, people living below the poverty level, people living below two times the poverty level, and linguistically isolated people.⁹¹ To perform these analyses, EPA uses EJScreen—its environmental justice tool⁹²—and the data within it to compare the demographics of communities in affected areas to the national averages.⁹³

In its Revised Definition of “Waters of the United States,” EPA undertakes three separate analyses: environmental justice, tribal impact, and sectoral. For the environmental justice analysis, EPA uses EJScreen to compare communities in affected areas to the national averages.⁹⁴ In the proposed rule’s environmental justice analysis, EPA considers distributional impacts across the following demographic groups: people living below two times the poverty level, people

belonging to a minority racial/ethnic group, adults without a high school diploma, linguistically isolated households, children under the age of five, adults aged 64 and older, and people belonging to an American Indian tribe.⁹⁵

DOE is more consistent across its distributional analyses than EPA. In part, this consistency derives from DOE's interpretation of the Energy Policy and Conservation Act (EPCA) requirements, under which the agency must consider the economic impact of energy-efficiency standards on consumers.⁹⁶ Since at least 1996, the agency has interpreted the EPCA's language to require it to take into account impacts on significant subgroups of consumers, including low-income consumers.⁹⁷ As a result, DOE considers impacts on low-income households/consumers across its distributional analyses in Energy Conservation Standards for Manufactured Housing,⁹⁸ Energy Conservation Standards for Room Air Conditioners,⁹⁹ and Energy Conservation Standards for Consumer Clothes Dryers.¹⁰⁰ DOE's Energy Conservation Standards for Room Air Conditioners¹⁰¹ and Energy Conservation Standards for Consumer Clothes Dryers¹⁰² additionally consider the impacts on senior-only households.

Generally, agencies should be consistent in which subgroups they consider and how they categorize them. Adhering to a more structured approach allows agencies to assess whether and how its collective rulemakings are moving the needle on distributional goals. However, there may be cases where using additional subgroups is justified where the regulation specifically targets or affects a certain group of people. For example, in NESHAP: Coal- and Oil-Fired Electric Utility Steam Generating Units proposed rule, EPA considers the impacts of mercury and hazardous air pollutant reduction on subsistence fishers, particularly women of child-bearing age and their children.¹⁰³ EPA notes that subsistence fishers consume self-caught fish, and as a result, "experience elevated levels of exposure to chemicals that bioaccumulate in fish including, in particular, methylmercury," leaving women subsistence fishers and their

children more vulnerable to the harms.¹⁰⁴ In those cases, such analysis should be performed in addition to the standard distributional analysis, and the agency should explain why the deviation from the standard practice is appropriate.

IV. LIMITED CONSIDERATION OF COSTS AND BENEFITS WITHIN DISTRIBUTIONAL ANALYSIS

Circular A-4—OMB’s guidance document for conducting regulatory impact analyses under Executive Order 12866¹⁰⁵—provides agencies with detailed guidance on how to conduct this analysis. However, Circular A-4 contains just two paragraphs addressing how agencies should consider “distributional effects.”¹⁰⁶ It indicates that regulatory analyses should “provide a separate description of distributional effects . . . described quantitatively to the extent possible . . .”¹⁰⁷ But it provides no guidance on how these analyses should be done. Given this lack of guidance,¹⁰⁸ it is unsurprising that agency distributional analyses are inconsistent.

The lack of guidance proves especially consequential with respect to agencies’ decisions to identify which categories of costs and benefits to include in the distributional analyses and how to disaggregate these categories. Circular A-4 directs agencies, to the extent feasible, to include *all* quantifiable costs and benefits in their cost-benefit analyses and to discuss all relevant unquantifiable costs and benefits. However, a similar guidance for distributional analysis does not exist. As a result, we see that, even when agencies conduct distributional analyses, the analyses often focus on a limited set of costs and benefits, leading to a scope too narrow to prove useful. In addition, Circular A-4 does not provide guidance to agencies on how to disaggregate costs and benefits among subgroups. Without proper disaggregation it is not possible for agencies to fully understand the distributional consequences of the rules they promulgate.

A. Excluded Categories

Our analyses reveal that agencies tend to conduct distributional analyses across fewer categories of quantifiable costs and benefits than those they evaluate in their cost-benefit analyses. In addition, agencies tend to omit pertinent discussions of unquantified costs and benefits in their distributional analyses,

104. *Id.* at 7637 n.29, 7664 (citing Joanna Burger, *Daily Consumption of Wild Fish and Game: Exposures of High-End Recreationalists*, 12 INT’L J. 107. *Id.*

108. See Revesz & Yi, *supra* note 9, at 82.

even when they could have significant impacts on disadvantaged communities.¹⁰⁹

In terms of quantifiable benefits, Circular A-4 instructs agencies performing regulatory impact analyses to “quantify *all* potential incremental benefits and costs” to the extent feasible.¹¹⁰ It explains that benefit-cost analysis is a compelling tool for regulatory analysis because “[w]here *all* benefits and costs can be quantified and expressed in monetary units, benefit-cost analysis provides decision makers with a clear indication of the most efficient alternative”¹¹¹ Where fewer categories are (or can be) considered, cost-benefit analysis becomes less helpful as a decision-making tool.¹¹² However, agencies do not apply the rigor Circular A-4 calls to their distributional analyses. We find that agencies consider fewer categories of costs and benefits in their distributional analyses compared to their cost-benefit analyses, rendering their distributional analyses less helpful as analytical tools.

For example, in EPA’s distributional analysis for its Heavy-Duty Engine and Vehicle Standards proposed rule, EPA considers distributional impacts on air quality by looking at two metrics: ozone and particulate matter (PM_{2.5}) reductions.¹¹³ In its analysis, the agency “found that (in absolute terms) the largest predicted improvements in both ozone and PM_{2.5} are estimated to occur in areas with the worst baseline air quality, where a substantially larger number of people of color are expected to reside.”¹¹⁴ This analysis is significantly limited compared to the agency’s full cost-benefit analysis, in which the agency not only quantifies PM_{2.5} and ozone reductions but also monetizes them.¹¹⁵

In addition, in its cost-benefit analysis, EPA considers additional benefits that flow from reductions in PM_{2.5} and ozone such as declines in hospital admissions and emergency department visits, asthma symptoms, restricted activity days, and school absence days, as well as avoided premature mortality.¹¹⁶ These benefits may be particularly pronounced in disadvantaged communities where people face greater barriers to care and receive lower levels of care when they do obtain it.¹¹⁷ EPA also considers the impact of the rule across

109. Arguably, it may be the case that one category of costs or benefits might be the main driver of distributional outcomes and just looking at that category might be justified from an agency resource perspective. However, the agency should explain and support that determination in its analysis.

a broader set of pollutants (hydrocarbons, air toxics, oxides of nitrogen, diesel exhaust, and carbon monoxide); the rule's impacts on traffic and derivative benefits; and the rule's impacts on employment.¹¹⁸ Considering these categories of costs and benefits in its distributional analysis could have helped EPA better understand the distributional consequences of its Heavy-Duty Engine and Vehicle Standards proposed rule. But EPA does not explain why it does not include these categories in its distributional analysis. Similarly, EPA's distributional analysis in the proposed rule of NESHAP: Coal- and Oil-Fired Electric Utility Steam Generating Units focuses only on the benefits arising from reductions in methylmercury and hazardous air pollutant emissions.¹¹⁹ Meanwhile, the cost-benefit analysis for the rule also considers benefits arising from incidental emissions like SO₂, PM, ozone, and CO₂.¹²⁰ It is not clear why EPA does not consider these emissions in its distributional analysis of this rule, especially when some of these categories play a prominent role in the distributional analysis of the Heavy-Duty Engine and Vehicle rule.¹²¹

EPA's distributional analysis in its Phasedown of Hydrofluorocarbons rule has a similarly narrow focus compared to the agency's cost-benefit analysis. In its distributional analysis, it considers only co-pollutants and their toxicity-weighted concentrations.¹²² But in its cost-benefit analysis, EPA considers more categories of costs and benefits including the social cost of each hydrofluorocarbon (HFC) and broader labor impacts.¹²³ To be fair, lack of data or modeling could be driving this lack of disaggregation. However, for many variables, EPA offers no explanation as to their absence from the distributional analyses. For other variables—such as total cancer and respiratory risk—EPA explains that it could not disaggregate the data by race, ethnicity, or income.¹²⁴ Instead, it analyzed “the total cancer and respiratory risk for communities near the eight HFC production facilities.”¹²⁵

We also find that agencies do not adequately discuss unquantified costs and benefits in their distributional analyses. In Circular A-4, OMB instructs that, where agencies are “not able to quantify the effects [of a rule, agencies] should

present any relevant quantitative information along with a description of the unquantified effects . . .”¹²⁶ Perhaps because similar explicit guidance for distributional analyses is lacking, our analysis finds that agency distributional analyses do not consider unquantified effects even when agencies often address unquantified benefits in their cost-benefit analyses.

In fact, most of the rules in our sample do not discuss unquantified impacts at all in their distributional analyses. One exception is EPA’s Phasedown of Hydrofluorocarbons. In its distributional analysis, EPA acknowledges the potential for “inadvertent or unexpected distributional effects from this program” such as those arising from “the release of toxic chemicals that are feedstocks, catalysts, or byproducts in the production of HFCs or HFC substitutes.”¹²⁷ The agency notes that these effects are most likely to be experienced by farmers working proximate to these sources as well as other disadvantaged communities.¹²⁸ In the transition period, EPA explains that there may be certain adverse health risks “for communities living near facilities that produce HFCs and HFC substitutes, to the extent the use of toxic feedstocks, byproducts, or catalysts changes and those chemicals are released into the environment.”¹²⁹ Importantly, EPA recognizes the potential for heterogeneous effects across groups due to these unquantified effects.

B. Lack of Disaggregation

Our analysis also reveals that agencies do not sufficiently disaggregate the costs and benefits they consider among affected subgroups. Without this disaggregation it is not possible to determine how a rule may affect disadvantaged communities. Below we provide two examples of categories of costs and benefits that agencies considered as part of their cost-benefit analysis but did not sufficiently disaggregate for their distributional analysis.

One example concerns energy prices. For example, in the cost-benefit analysis for NESHAP: Coal- and Oil-Fired Electric Utility Steam Generating Units, EPA projects a small but nonzero (0.3 cents/kWh) increase in national electricity prices.¹³⁰ Ultimately, it dismisses the slight increase as inconsequential, noting that the deviation falls within historical price fluctuations.¹³¹

While this reasoning may hold in aggregate, it overlooks the fact that the rule affects only *certain* power plants. Areas where affected plants are located may face disproportionately higher price increases than the national average.

126. CIRCULAR A-4, *supra* note 105, at 27.

127. Phasedown of Hydrofluorocarbons, 86 Fed. Reg. 55116, 55126 (Oct. 5, 2021) (to be codified at 40 C.F.R. pts. 9, 84) at 55126.

128. *Id.* at 55126–27.

129. *Id.* at 55127.

130. NESHAP: Coal- and Oil-Fired Electric Utility Steam Generating Units, 87 Fed. Reg. 7624, 7658 (proposed Feb. 9, 2022) (to be codified at 40 C.F.R. pt. 63).

131. *Id.*

And, as disadvantaged communities also tend to be already energy burdened, any price increase may be particularly pronounced in these communities. Similarly, if a policy reduces energy prices by a small percentage, that does not mean the policy is inconsequential from a distributional standpoint. For example, one analysis done for the Inflation Reduction Act shows that even though the law is projected to reduce household energy expenditure by 0.7 percent on average nationally, the lowest income quintile would see savings closer to 1.8 percent.¹³² To deal with such distributional effects, agencies need more granular analyses which first determine areas in which price increases are likely and then determine the demographics of those regions.

Another example concerns impacts on employment. In the Draft Regulatory Impact Analysis for the Heavy-Duty Engine and Vehicle Standards proposed rule, EPA considers the impact of the regulation on employment.¹³³ As part of the quantitative analysis, EPA estimates *cost effects*—the impact on employment due to increased costs from adopting technologies needed for vehicles to meet the standards.¹³⁴ To estimate these effects, EPA uses the historic share of labor in the cost of production to predict how labor demands will change in response to compliance with the proposed regulation.¹³⁵ Specifically, EPA “multipl[ies] the share of labor in production costs by the production cost increase estimated as an impact of this rule.”¹³⁶ However, this analysis is not sufficiently granular to understand how the rule will affect relevant labor subgroups—particularly disadvantaged communities.

EPA’s analysis overlooks the fact that a regulation may affect the nature of an industry’s workforce. For example, the workforce required to comply with regulations may look very different from the workforce that gets displaced. As a result, labor hours associated with higher compliance costs may be fulfilled by a different group of workers, potentially from a different socio-economic group. Thus, a more granular analysis is required to determine a regulation’s labor effects. Moreover, manufacturers may close noncompliant plants and open new, compliant plants in completely different regions. Once again, the job creation associated with compliance would be attained by a different group of workers. More extensive analysis is required to understand these effects. And, if lack of analysis is due to lack of data, agencies should explain that and start the data collection process as part of their broader efforts to improve distributional analysis.

V. TOWARDS A BETTER APPROACH

As we explain in Part II, without a distributional analysis of alternatives, it is not possible for an agency to determine when the better distributional consequences of one alternative should outweigh the higher net benefits of another one. Thus, unless analysis of alternatives becomes institutionalized, it is inevitable that regulatory policy will pay inadequate attention to the impact on disadvantaged communities. In this Part, we discuss the two rules, out of the fifteen rules in our sample, in which the agency, in both cases DOE, analyzed the distributional consequences of alternatives. We also discuss a third DOE rule, the Energy Conservation Standards for Manufactured Housing, in which, while the agency did not perform this analysis, it justified, on distributional grounds, the alternative that it ultimately selected.

In the final rule for the Energy Conservation Standards for Manufactured Housing, DOE rejects a more stringent standard in the proposed rule on distributional grounds. DOE had initially proposed an untiered standard, which applied to all manufactured housing. In the final rule, it instead adopts a tiered standard, under which “a subset of the energy conservation standards (based on retail list price) would be less stringent for certain manufactured homes.”¹³⁷ The untiered standard, which DOE rejects in the final rule, had higher net benefits than the tiered standard¹³⁸ which the agency chooses. In making this choice, DOE explains that the untiered standard does not adequately address the affordability of manufactured housing for low-income consumers.¹³⁹

While it is significant that DOE selected a rule that addresses affordability concerns rather than the rule that yields the highest net benefits, DOE’s analysis is still incomplete.¹⁴⁰ It simply assumes that the untiered approach raises insurmountable affordability concerns, rather than doing a side-by-side analysis of the net benefits and distributional outcomes. As a result, DOE never faces the question of how to trade off the higher net benefits of one rule against the better distributional consequences of another one. In other words, the Manufactured Housing rule does not involve a distributional analysis of different alternatives, which Part II argues is the gold standard for distributional analysis.

But DOE does analyze the consequences of alternatives in two other rules. In evaluating the proposed Energy Conservation Standards for Room Air Conditioners, DOE analyzes the impacts of the proposed standards on low-income and senior-only households,¹⁴¹ evaluating multiple policy scenarios, referred to as trial standards levels (TSLs). For each TSL for product classes with

137. Energy Conservation Program: Energy Conservation Standards for Manufactured Housing, 87 Fed. Reg. 32728, 32729 (May 31, 2022) (to be codified at 10 C.F.R. pt. 460).

138. See DOE TECHNICAL SUPPORT DOCUMENT FOR MANUFACTURED HOUSING, *supra* note 59, at 15-3.

140. See *id.* at 9.61-9.63.

141. DOE Technical Support Document for Room Air Conditioners, *supra* note 99, at 11-1.

a sufficient sample size, the agency calculates average lifecycle-cost savings relative to the no-new-standards scenario for each subgroup.¹⁴² Following extensive analysis, the agency finds that “[i]n most cases, the values for low-income households and senior-only households at the considered efficiency levels are not substantially different from the average for all households.”¹⁴³ As a result, the distributional analysis ends up not affecting the choice of standard.

The situation is different for the proposed Energy Conservation Standards for Consumer Clothes Dryers rule, which represents the most promising approach to distributional analysis of the fifteen rules analyzed in this article. There, DOE evaluates the net benefits and distributional consequences of six TSLs.¹⁴⁴ But, for this regulation, the agency’s choice of alternative is significantly affected by the distributional analysis.

To determine which alternative to select in the Clothes Dryer rule, DOE employs a “walk-down” approach, evaluating first the most stringent standards and proceeding then, in turn, to the less stringent alternatives.¹⁴⁵ In its cost-benefit analysis, DOE finds the rule yields the highest overall net benefits at the two most stringent TSLs: TSL 6 and TSL 5.¹⁴⁶ And yet, DOE does not select either of these options. For both these TSLs, DOE finds that the rule’s energy-saving, emissions reduction, and consumer benefits would all be outweighed by the economic burden the standard places “on many consumers, *especially senior consumers*, as well as the impacts on manufacturers.”¹⁴⁷ At TSL 6, for example, DOE estimates that more than 65 percent of senior consumers would experience increased net life-cycle costs.¹⁴⁸ Moreover, consumers with the lowest-performing existing electric standard clothes dryers (often low-income consumers) were “more likely to experience a net cost” at TSL 6.¹⁴⁹

Ultimately, DOE adopts TSL 3, which yields less than half the societal net benefits than either TSL 5 or TSL 6.¹⁵⁰ But at TSL 3, DOE finds that “across the product classes, less than 1 percent of the consumers, including low-income consumers, will experience a net [lifecycle] cost.”¹⁵¹ DOE also finds that only 1 percent of senior consumers will face higher net costs under TSL 3.¹⁵²

142. Energy Conservation Program: Energy Conservation Standards for Room Air Conditioners, 87 Fed. Reg. 20608, 20656–62 (proposed Apr. 7, 2022) (to be codified at 10 C.F.R. pts. 429, 430).

143. *Id.* at 20656.

144. Energy Conservation Program: Energy Conservation Standards for Consumer Clothes Dryers, 87 Fed. Reg. 51734, 51795 (proposed Aug. 23, 2022) (to be codified at 10 C.F.R. pt. 430).

145. *Id.* at 51796.

148. *Id.* at 51799.

149. *Id.*

150. *Id.* at 51796 (TSL 3 yields less than half the overall net benefits of TSL 5 or TSL 6 across all scenarios and discount rates).

151. *Id.* at 51801.

152. *Id.*

Even though DOE relies extensively on the distributional analysis to pick a less stringent standard with lower net benefits, it does not explicitly state or imply that it selected TSL 3 due solely to the distributional impacts on disadvantaged communities. For example, it also states that under TSL 3, all consumer groups benefit from higher lifecycle cost savings and fewer consumers face higher net costs.¹⁵³ And, moreover, at this level the manufacturing industry faces lower conversion costs and a lower maximum decrease in industry's net present value.¹⁵⁴

DOE's attention to the impacts low-income and senior-only households would experience at each trial standard level and justification of the final rule on this distributional consideration represent a meaningful difference from the approaches taken in many other rulemakings. However, DOE's analysis does not provide much guidance or insight as to how the agency would handle scenarios in which the impacts on and interests of disadvantaged communities do not align with the interests of other significant groups (in this case, consumers more broadly and also manufacturers). Therefore, further analytical work remains to be done on the question of how agencies consider distributional impacts on disadvantaged communities and the associated tradeoffs in their rulemakings.

CONCLUSION

The Biden-Harris Administration has made attention to distributional issues in general and environmental justice issues in particular a centerpiece of its policy focus. And it has explicitly indicated that distributional considerations should play a significant role in the regulatory process.

This Article examines how this vision was implemented by evaluating fifteen important proposed and final rules promulgated during the Biden-Harris Administration's first eighteen months. The main conclusion that emerges from this analysis is that significant analytical work remains to be done to realize the administration's goal. First, the administration should specify with more particularity what it means by "appropriately benefit and do not inappropriately burden disadvantaged . . . communities," eliminating the inconsistent approaches currently in use. Second, it should routinely evaluate the distributional consequences of multiple alternatives to its proposed rule; without this analysis agencies will not be in a position to determine when the better distributional attributes of one alternative should outweigh the higher net benefits of another one. Third, the administration should use a consistent definition of "disadvantaged communities," or explain why departures from a standard approach are desirable in particular situations. Fourth, it should consider a

153. *Id.* at 51802.

154. *Id.*; *see id.* at 51799 (Meanwhile, under TSL 6, for example, DOE projected a contraction of the manufacturing industry's net present value by upwards of \$1,077.6 million).

complete set of costs and benefits in its distributional analysis, and not a truncated subset of those that it considers in its cost-benefit analysis.

One of the fifteen regulations, the DOE's clothes dryer rule, shows that this work can be done. In it, DOE analyzed six different alternatives, determined how each alternative would affect specific demographic subgroups, and factored its distributional analysis in its final rule. The approach set forth in that regulation, with the necessary improvements, should be institutionalized so that it becomes the norm and not an aberration.

APPENDIX

<i>Rule Name</i>	<i>Agency</i>	<i>Status (Date)</i>	<i>Description</i>
<i>Safety Standard for Operating Cords on Custom Window Coverings</i>	CPSC	Proposed Rule (Jan. 2022)	Addresses the risk of strangulation to young children from custom window covering cords by proposing that operating cords on custom window coverings must be cordless, inaccessible, or 8 inches or shorter in length in any use position. ¹⁵⁵
<i>Baseline Energy Efficiency Standards Update for New Federal Commercial and Multi-Family High-Rise Residential Buildings</i>	DOE	Final Rule (Apr. 2022)	"[U]pdates the energy efficiency standards for new Federal buildings to [American Society of Heating, Refrigerating and Air-Conditioning Engineers ('ASHRAE')] Standard 90.1-2019 for buildings for which design for construction begins on or after one year after this rule is published." ¹⁵⁶
<i>Energy Conservation Program: Energy Conservation Standards for General Service Lamps</i>	DOE	Final Rule (May 2022)	Establishes a requirement that general service lamps have efficiency of at least 45 lumens per watt (lm/W) pursuant to authority under the EPCA, as amended under the Energy Independence and Security Act (EISA). ¹⁵⁷
<i>Energy Conservation Program: Energy Conservation Standards for Manufactured Housing</i>	DOE	Final Rule (May 2022)	Establishes energy conservation standards for manufactured housing pursuant to an EISA mandate. ¹⁵⁸
